

C: an introduction

Arrays - basics

Why arrays?

```
1/*
2average_grade_bruteforce.c
3Averaging ten grades - storing values the hard way
4taken from I. Horton: Beginning C 5th Ed
5*/
6
7#include <stdio.h>
8int main(void)
9{
10    int grade0 = 0, grade1 = 0, grade2 = 0, grade3 = 0, grade4 = 0;
11    int grade5 = 0, grade6 = 0, grade7 = 0, grade8 = 0, grade9 = 0;
12    long sum = 0L; // Sum of the grades
13    float average = 0.0f; // Average of the grades
14
15    // Read the ten grades to be averaged
16    printf("Enter the first five grades:\n");
17    printf("use a space or press Enter between each number.\n");
18    scanf("%d%d%d%d%d", &grade0, &grade1, &grade2, &grade3, &grade4);
19    printf("Enter the last five numbers in the same manner.\n");
20    scanf("%d%d%d%d%d", &grade5, &grade6, &grade7, &grade8, &grade9);
21
22    // Calculate the average
23    sum = grade0 + grade1 + grade2 + grade3 + grade4 +
24    grade5 + grade6 + grade7 + grade8 + grade9;
25    average = (float)sum/10.0f;
26    printf("\nAverage of the ten grades entered is: %.2f\n", average);
27    return 0;
28}
```

```
1/*
2average_grade_array.c
3Averaging ten grades - storing the values the easy way
4taken from I. Horton: Beginning C 5th Ed
5*/
6
7#include <stdio.h>
8
9int
10main (void)
11{
12    int grades[10]; // Array storing 10 values
13    unsigned int count = 10; // Number of values to be read
14    long sum = 0L; // Sum of the numbers
15    float average = 0.0f; // Average of the numbers
16
17    printf ("\nEnter the 10 grades:\n"); // Prompt for the input
18    // Read the ten numbers to be averaged
19    for (unsigned int i = 0; i < count; ++i)
20    {
21        printf ("%2u ", i + 1);
22        scanf ("%d", &grades[i]); // Read a grade
23        sum += grades[i]; // Add it to sum
24    }
25
26    // calculate the average
27    average = (float) sum / count; // Calculate the average
28    printf ("\nAverage of the ten grades entered is: %.2f\n", average);
29    return 0;
30}
```

Array basics

- Array: a block of memory that holds one or more objects of a given type.
- Array: store multiple data with common characteristics
 - Same name
 - Same type
 - Accessed by specifying subscript(s) (indexing starts at position 0!)

Array basics

- Example

```
int arr[ 10 ] ;
```

Array basics

- Declare an array:
 - Declare the **type** of elements
 - Declare the **maximum** number of elements.

```
double empty[0]; /* Error: cannot be empty */
int an_array[10]; /* allocate for 10 ints. */

a = an_array[0]; /* first element */
b = an_array[9]; /* last element */
c = an_array[10]; /* Error: but will compile */
```
- Elements of an array are stored at consecutive locations in memory (contiguous memory)
 - Easy access
 - Difficult for large arrays
- Access to arrays is performed without bounds checking. Bounds checks must be applied explicitly by the programmer.

Array Initialisation

- An array is not initialised by default.
- Can explicitly initialise an array using an initialiser list enclosed in braces `{}`.

```
int days[12] = { 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 };
```

- If the number of elements in the initialiser list is less than the size of the array, the remainder of an array is initialised to zero.

```
int local_array[50] = {0};
```

- If the number of elements is greater, it is an error.
- An array with an initialiser list may be sized automatically by the compiler.

```
int days[] = { 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 };
```

```

1 #include <stdio.h>
2 /*
3 array_init.c
4 based on http://gribblelab.org/cbootcamp/6_Complex_Data_Types.html
5 */
6
7 int main ()
8 {
9     int grades[5] = {11, 9, 14, 15, 13};
10    // int grades[5] = {11, 9, 14, 15, 13, 12}; // error?
11    int grades2[5] = {[0]=1, [2]=3, [4]=5};
12    int local_arr[10] = {-1};
13    int days[] = { 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 };
14
15    int i;
16
17    // what are the initial values?
18    for (i=0; i<5; i++) {
19        printf("grades[%d]=%d\n", i, grades[i]);
20    }
21
22    // what are the initial values?
23    for (i=0; i<5; i++) {
24        printf("grades2[%d]=%d\n", i, grades2[i]);
25    }
26
27    // out of the boundary?
28    printf("grades[5]=%d\n", grades[5]);
29    printf("grades[100]=%d\n", grades[100]);
30
31
32    // what are the initial values?
33    for (i=0; i<10; i++) {
34        printf("local_arr[%d]=%d\n", i, local_arr[i]);
35    }
36
37    // what are the initial values?
38    for (i=0; i<12; i++) {
39        printf("days[%d]=%d\n", i, days[i]);
40    }
41    return 0;
42 }

```

```

```

Assigning / Getting values

- Assignment of values:

```
array_x[1] = 61; /* 2nd element gets 61*/  
array_y[2] = 1.14;
```

- Accessing values from arrays:

```
val1 = array_x[2];  
val2 = array_y[0];
```

- Accessing variable `array_x[n]` = (n+1)th element!
- Tip: for-loops are ideal for processing array elements

Arrays and pointers

- Arrays and Pointers are strongly related.
- Whenever an array name appears in an expression, it is automatically converted to a pointer to its first element.

```
1#include <stdio.h>  
2/*  
3array_pointer_1.c  
4based on Computer programming in C for beginners  
5*/  
6  
7int main ()  
8{  
9    int grades[5]={10, 12, 11, 16, 7};  
10  
11    printf("The address contained in grades is %p \n", grades);  
12    printf("The address of grades[0] is %p \n", &grades[0]);  
13  
14    return 0;  
15}
```

```
frankvp@CRD-L-08004:~/Arrays$ gcc array_pointer_1.c -o array_pointer_1  
frankvp@CRD-L-08004:~/Arrays$ ./array_pointer_1  
The address contained in grades is 0x7ffea01920c0  
The address of grades[0] is 0x7ffea01920c0  
frankvp@CRD-L-08004:~/Arrays$
```

- Array can be treated as a constant pointer that points to the first element in the array

• `int arr[10] ;`

Pointers and Arrays are Different

- An array name is not a variable – its value cannot be changed.

```
int a1[10], a2[10];
int *pa = a1;
a1 = a2; /* Error: won't compile. */
a1++;   /* Error: won't compile. */
```
- An array name always refers to the beginning of a segment of allocated memory.
A pointer may point anywhere (e.g., to allocated memory, to NULL, to free memory, to invalid locations).
- The size of an array is equal to the number of characters of memory allocated. The size of a pointer is just the size of the pointer-type.
- Pointers and array names may be used interchangeably for array indexing operations.

```

1 #include <stdio.h>
2 /*
3 array_pointer_2.c
4 based on Computer programming in C for beginners
5 */
6
7 int main ()
8 {
9     int grades[5]={10, 12, 11, 16, 7};
10    int points[5];
11    int * pa, * pb;
12    int sg, spa;
13
14    printf("The address contained in grades is %p \n", grades);
15    printf("The address of grades[0] is %p \n", &grades[0]);
16
17    pa = grades;
18    printf("The address contained in pa is %p \n", pa);
19
20    // points = grades; /* will this compile? */
21
22    grades[4] = 6; /* Equivalent indexes. */
23    printf("grades[4] updated %d \n", grades[4]);
24    pa[4] = 6;
25    printf("grades[4] updated %d \n", pa[4]);
26    *(grades + 4) = 6;
27    printf("grades[4] updated %d \n", *(grades+4));
28    *(pa + 4) = 6;
29    printf("grades[4] updated %d \n", *(pa+4));
30
31    pb = &grades[1]; /* Equivalent addresses. */
32    pb = &pa[1];
33    pb = grades + 1;
34    pb = pa + 1;
35
36
37    sg = sizeof(grades);

Passing arrays to functions

- Array names are in fact pointers!
- Actually passing an array by reference, rather than by value
 - Passing the array name only to the called function (without the brackets).
 - Pass the size of the array, the calling function knows the size of the array
- The two prototypes below are exactly equivalent.

```
int count_days(int days[]);
```

```
int count_days(int *days);
```

KU LEUVEN

Passing arrays to functions

```
1#include <stdio.h>
2#include <stdlib.h>
3/*
4array_passing_1.c
5based on Computer programming in C for beginners
6*/
7void double_it(int [], int); // prototype
8int main()
9{
10    int arr[10] = {0}, n;
11    for(n=0; n<10; n++)
12        printf("The content of cell %d is initially %d \n", n, arr[n]);
13    double_it(arr, 10);
14    printf("\n\n");
15    for(n=0; n<10; n++)
16        printf("The content of cell %d is now %d \n", n, arr[n]);
17    return 0;
18}
19
20void double_it(int a[], int i)
21{
22    int k = 0;
23    a[0] = 1;
24    for(k=1; k<i; k++)
25        a[k] = a[k-1] * 2;
26}
```

```
frankvp@CRD-L-08004:~/Arrays$ gcc array_passing_1.c -o array_passing_1
frankvp@CRD-L-08004:~/Arrays$ ./array_passing_1
The content of cell 0 is initially 0
The content of cell 1 is initially 0
The content of cell 2 is initially 0
The content of cell 3 is initially 0
The content of cell 4 is initially 0
The content of cell 5 is initially 0
The content of cell 6 is initially 0
The content of cell 7 is initially 0
The content of cell 8 is initially 0
The content of cell 9 is initially 0

The content of cell 0 is now 1
The content of cell 1 is now 2
The content of cell 2 is now 4
The content of cell 3 is now 8
The content of cell 4 is now 16
The content of cell 5 is now 32
The content of cell 6 is now 64
The content of cell 7 is now 128
The content of cell 8 is now 256
The content of cell 9 is now 512
frankvp@CRD-L-08004:~/Arrays$

Multidimensional 2D

- `a[i][j]`, *not* `a[i, j]`

- Initilize:

- **Row dominant**

- Use {}

```
int a[3][4]={
    {0, 1, 2, 3},
    {4, 5, 6, 7},
    {8, 9, 10, 11}};
```

or

```
int a[3][4] = {0,1,2,3,4,5,6,7,8,9,10,11};
```

	Column 0	Column 1	Column 2	Column 3
Row 0	<code>a[0][0]</code>	<code>a[0][1]</code>	<code>a[0][2]</code>	<code>a[0][3]</code>
Row 1	<code>a[1][0]</code>	<code>a[1][1]</code>	<code>a[1][2]</code>	<code>a[1][3]</code>
Row 2	<code>a[2][0]</code>	<code>a[2][1]</code>	<code>a[2][2]</code>	<code>a[2][3]</code>

https://www.tutorialspoint.com/cprogramming/c_multi_dimensional_arrays.htm

Matrix calculations

- multidimensional arrays to represent matrices
- better to make use of one of the pre-existing APIs for matrix algebra, rather than coding up this yourself.
- Common choices:
 - The GNU Scientific Library GSL [Vectors and Matrices](#)
 - [LAPACK](#) (and [BLAS](#)) libraries
